#### 1 Overview

IN THIS CHAPTER

- ▶ Introduction
- ▶ sliceKIT system layout

### 1.1 Introduction

This document covers the hardware design of the sliceKIT Modular Development System, consisting of the A16 Core Board, sliceCARDs and XSYS adaptor.

The Core Board contains a fully pinned out 16-core xCORE Processor, with its GPIOs connected to four expansion connectors (termed Slots) to interface with expansion cards called sliceCARDs which plug into the slots. The Core Board also contains all circuitry necessary for operating and debugging the XMOS system. Multiple sliceKIT Core Boards can be interconnected to form a multi XMOS device system with dual 5-bit xCONNECT Links being present between the boards.

# 1.2 sliceKIT system layout

Figure 1: sliceKIT Layout

The diagram above shows an overview of the layout of the core board with slice boards attached. Each of the four slots has a specific label - Star, Triangle, Square and Circle, printed on the Core Board silkscreen. Triangle and Circle sliceCARDs contain 24 xCORE I/Os and Star and Square sliceCARDs 20 xCORE I/Os (usable as GPIO or two 5-wire XMOS links). The label denotes which sliceCARDs are compatible with which Core Board Slots. The sliceCARDs are also marked with one or more of these labels to identify the slot type(s) they function correctly with.

In addition to the four standard sliceCARD slots there is a Mixed Signal slot, labelled A, this slot has access to the 8 ADC channels available on the A16 device, along with 4 xCORE I/Os and the wake pin. The xCORE I/Os available on the Mixed Signal slot overlap with the Star slot, meaning that if the Mixed Signal I/Os are used then a sliceCARD used in the Star slot may not function.

The final type of connector is on the bottom left of the Core Board and is marked with a hollow square symbol with an X through it. This is for connecting multiple Core Boards together to form systems of 32 logical cores or more. It is termed the chain slot.

All Slots are 36 pin PCI express style connectors in either socket or edge finger (plug) types.

Star, Triangle and Mixed Signal Slots are pinned out from Tile 0 of the A16 xCORE and the Circle and Square Slots from Tile 1.

# 2 Core Board

#### IN THIS CHAPTER

- ► Multiple Core Boards
- ▶ Setup
- ▶ Power Supply
- ▶ Debug
- ► A16 Boot
- ▶ xCONNECT Links
- ▶ Reset
- ▶ Clocking
- ► Testpoints
- ▶ Slot pinouts

This board contains the XMOS device plus support circuitry.

A single XS1-A16A-128 device has all of its GPIO connected to the Slots.

Figure 2: A16 sliceKIT Core Board

### 2.1 Multiple Core Boards

Additional A16 or L16 sliceKIT Core Boards can be connected to the first board's Chain slot via the second board's Square Slot to add extra processing capability and I/O through extra Slice Cards. The first such board is termed the Master, the remaining boards as Slaves. When there is only one board, it is the Master.

### 2.2 Setup

For debugging, an XSYS adaptor board is connected to the Chain Connector of the Master Board to allow connection of an xTAG debug adapter to provide a debug link from a USB host.

The Core Board is powered by a 12V external power supply.

## 2.3 Power Supply

Power input to the sliceKIT Core Board is via a standard barrel jack connector. A standard 12V external power supply should be used to power the board. Each Core Board requires its own 12V supply. This input supply is used to generate the main 5V board supply via a DC-DC converter.

The 5V board supply is then fed to all the Slot connectors as well as powering the Core Board itself. A 3V3 supply is generated by DC-DC converters from the 5V main supply.

The A16 device uses integrated DC-DC converters to generate the 1V8 and 1V0 supplies required by the device.

The supplies are sequenced to ensure the power up sequence is 5V then 3V3. When the 3V3 supply is good then the system will be released from reset.

The Core Board provides 3V3 and 5V at 0.25A each for a total of approximately 2W per slice.

# 2.4 Debug

Debug of the system is via the XSYS adapter board connected to the Chain Connector.

The JTAG signals are connected as shown below.

Presence detect signals are present on both the Chain Connector and Square Slot connectors to allow detection of a connected board and subsequent automatic switching of the JTAG chain. In a system of multiple Core Boards, the Master is the source of the JTAG chain so the system can only be debugged from the master. Other boards will see no devices in the JTAG chain.

The use of xSCOPE is covered in the xCONNECT Links section. The xSCOPE xCONNECT link can be either enabled or disabled via a switch on the XSYS adapter board.

#### 2.5 A16 Boot

Master Core Boards boot from SPI flash, while slave Core Boards boot from xCON-NECT link XLB from the next connected Core Board.

To allow re-use of the SPI boot pins (ports 1A, 1B, 1C, 1D) as signal I/O pins for the Star, Triangle and A slot, a latched bus switch is used which connects the xCORE SPI pins to either the SPI Flash or to the Slice Card Slots. The switch is controlled by X0D42 and X0D43 (P8D6 and P8D7 on Tile 0: on the Triangle slot). Once the device has booted X0D43 is used to enable or disable the SPI interface, X0D42 should then transition from low to high to latch the selection. The SPI selection state is then maintained until the system is reset.

Once this sequence is completed the selection has been latched, therefore X0D42 and X0D43 return to performing their normal functions in the Triangle slot.

If the SPI is not disabled, then Slice Cards in the Star, Triangle or A slots may not function as expected. If there are no Slice Cards in the Star, Triangle or A slot, then it does not matter whether the SPI has been disabled or not. Therefore, applications which require runtime access to the SPI flash should either leave the Star, Triangle and A slots unpopulated or check to ensure that the Card which is in there will be unaffected by the operation of the Flash.

The xTAG debug system can use the boot mode select signal to force all devices in the chain (master and slave Core Boards) to boot from JTAG (don't boot) for debug purposes.

If not in this mode, the devices will boot from SPI or xCONNECT link as appropriate.

#### 2.6 xCONNECT Links

The Chain Connector contains two 5-bit xCONNECT links, XLA and XLB, which can be used for chaining sliceKIT Core Boards together. The links from Tile 0 are connected to the Chain Connector and the Star Slot. The links from Tile 1 are connected to the Square Slot.

The only complication in this system is use of the xSCOPE 2-bit xCONNECT Link. This link overlaps a 4 bit port on the Star Slot connector so it would not be possible to use this for user I/O at the same time as xSCOPE.

To work around this, a switch is present on the XSYS adapter board to either enable or disable the xSCOPE xCONNECT Link.

When disabled, these pins are disconnected from the Chain Connector and are free for use on the Star Slot. When enabled they will work as an xCONNECT link and hence will appear on the relevant pins of the Star Slot.

It is recommended that if a sliceCARD is used in the Star Slot the xSCOPE switch is off on the XSYS Adaptor Card to ensure correct operation of the sliceCARD in the Star slot.

#### 2.7 Reset

The whole system is held in reset until all power supplies are stable, and reset is connected to all Slice Cards so any circuitry on them can be reset.

It also indicates to the sliceCARDs that their power input is stable. The reset from the xTAG resets the whole system, if required for debugging.

### 2.8 Clocking

There are two sources for the system clock: an on-board 25MHz oscillator or the CLK signal from the Chain Connector. The system clock source is selected automatically according to the presence signals on the Chain connector.

This means the system clock from a Master Core Board is fed automatically to all of the slave Core Boards so the whole system will operate synchronously.

The system clock is also fed to each of the sliceCARD Slots.

### 2.9 Testpoints

Each xCORE I/O signal is also available on a 0.1" header, next to the Slot that it is connected to.

These connections can be used to connect an oscilloscope or logic analyser, or for interconnection of signals for advanced development work.

The signals are identified on the silkscreen layer of the sliceKIT Core Board, the table below lists their relationship to the internal ports.

#### 2.10.7 System Services Slot Signals

On all Slots, TDO is always out of the sliceKIT Core Board, TDI is always in to the Core Board.

MSEL, TCK, TMS, RST\_N are all inputs to the Core Board from the Chain Connector and outputs from the Core Board on the Square Slot.

DEBUG is bidirectional.

PRSNT is used on the Chain Connector to detect it is plugged into the Square Slot of another Core Board. This signal is used to switch JTAG and CLK sources.

Similarly, PRSNT\_N is used on the Star Slot to detect another Core Board is connected. This signal is used to switch the JTAG chain signals.

CLK and RST\_N are inputs to the Core Board from the Chain Connector and output from all Slots.

sliceKIT sliceCARDs are used to implement peripheral circuitry as part of the sliceKIT platform.

Existing sliceCARDs may connect to some or all of the Star, Triangle, Square and Circle slots. Their compatibility with each slot is indicated by the range of symbols printed on the sliceCARD silkscreen. A Card having all four symbols is compatible with all slots, a subset of symbols indicates that some slots don't have sufficient I/O or suitable I/O resources to work with that Card.

Star and Square sliceCARDs have 20 xCORE Processor I/Os including four 1-bit ports.

Triangle and Circle sliceCARDs have 24 xCORE Processor I/Os including twelve 1-bit ports.

A Double sliceCARD is a board with two sliceCARD finger connectors and connects to all of the I/O on one Tile (e.g. to Star + Triangle or to Circle + Square).

Note that sliceCARDs compatible with a given slot may still have restrictions when used in that slot (typically less common or popular functionality may be disabled), so be sure to check the sliceCARD documents for details).

# 4 Designing a Slice Card

IN THIS CHAPTER

- ▶ Power
- ▶ Signal I/O
- ▶ sliceCARD Form Factors
- ▶ Connector Pinouts

#### 4.1 Power

sliceCARDs have two power supplies available to them, 5V and 3V3.

The 5V supply can range from 4.75V to 5.25V (5%) at a current of up to 0.25A per slice.

The 3V3 supply can range from 3.13V to 3.47V (5%) at a current of up to 0.25A per slice.

### 4.2 Signal I/O

A single sliceCARD connector has 36 contacts. The four types of slice have a number of common pins which are described below.

- ► GND. Power supply ground.
- ▶ 5V. 5V power supply input.
- ▶ 3V3. 3.3V power supply input.
- ▶ NC. Not connected.
- ► CLK. System clock input. 25MHz.
- ▶ RST\_N. System reset input, active low. Push-Pull drive.

The other available pins are connected to xCORE Processor I/Os as shown in the pinout tables.

sliceCARDs can take their power from either 5V or 3V3 or both. sliceCARDs should draw no more than 250mA from each supply.

At system power-on, the 5V supply will power up first, followed by the 3V3 supply. The system reset signal will de-assert a short time after this.

Due to the constraints on the sliceKIT Core Board, there are some ports on the sliceCARDs which should be used in preference to others. These constraints are as follows:

- ▶ X0D4-7 can be selected for use as the xSCOPE xCONNECT Link
- ➤ X0D0,1,10,11 could be used for SPI boot on a master core board. These pins will be hi-z when booting and can be transferred to the xCORE I/O signals when boot is complete.

For sliceCARDs intended for use in the Star Slot, P4B should be avoided with the knowledge that using it means xSCOPE can not be used if the sliceCARD is plugged into the Star Slot.

#### 4.3 sliceCARD Form Factors

The sliceCARDs use a standard PCIe x1 edge finger to connect to the sliceKIT Core Board. Because of this, all sliceCARD PCBs must be 1.6mm thick.

There is no hard specification as to the length of sliceCARDs as this poses no mechanical clashing hazard, however to avoid clashing with other sliceCARDs or the power input connector sliceCARDs should be limited to 40mm wide.

Four mounting holes are specified in the corners of the slice for mechanical stability. These should be used with 6mm standoffs, example part Toby Electronics DCB-6.

An optional retention hole is specified for use in securing the sliceCARD to the sliceKIT Core Board. This is useful to ensure the sliceCARDs is not accidentally unplugged when using the system. Typical usage uses a 2.54mm cable tie between this hole and the associated hole in the sliceKIT Core Board ensuring the sliceCARD cannot be unplugged.

Figure 5: sliceCARD Detail

Note that for quick, low cost boards using low cost PCB manufacturing, the chamfer is not required and can be generated by hand using a file or similar.

### 4.4 Connector Pinouts

The pinouts of the four types of sliceCARD are shown below. To cross reference pin numbers (eq. X0D1) to port names, see here (see §2.9):
